

DAY 2 / 16:15 / ALPHALIST DEVELOPER BOOTCAMP

Reflect & Commit

WHAT YOU BUILT

Two days in three moves

01 Foundation

Tools that hold context across sessions: CLAUDE.md, skills, hooks, rules.

02 Pipeline

Stations that hand off work without you: planner, refine, implement, deterministic gates.

03 Factory

A loop that gets better on its own: observability, evals, learning loops.

WEEK 1

Start here: one slice, you in the loop

One use case. Three acceptance criteria.
You review it manually.

No gates yet. No automated stations. Just a
slice you can run end to end and judge
yourself.

Tune the building blocks in isolation

- One skill that runs without you steering it
- One hook that actually fires on the right event
- A CLAUDE.md that cuts noise, not just adds rules

Metric: can it complete a session without you redirecting it?

Pick one real slice. Wire the pipeline.

Apply the Day 1 pipeline contract to something you actually ship.

- A real feature endpoint
- An acceptance test a gate can run
- The contract as the glue: rename a heading and the next station breaks

Now the machine can stop itself

Gates are deterministic: a test run, `tsc`, a coverage number. Never an agent's self-assessment.

Observe the pipeline running first. Add a gate only when you know what it should catch.

6-8 WEEKS

This is where you could be

A Next.js full-stack pipeline. Spec-driven TDD. Autonomous agents do the work. Deterministic gates decide what advances.

Every forward transition is guarded by a machine verdict. Warm states are the only points a human is pulled in.

**You cannot gate what you cannot observe.
You cannot observe what you have not wired.
You cannot wire what you have not tuned.**

NOT A WHOLE FEATURE

SOMETHING A GATE CAN CHECK

BEFORE MONDAY

The one thing

01 **Pick your use case. Write three acceptance criteria for it — today, not Monday.**
That's what you bring to week 1. Everything else follows.

Before you leave this room

- | What is the one use case I am starting with?
- | What building block do I tune first?
- | What date does the first run happen?
